

Persona: 30-year-old first home buyer

It's 2028, and I've just printed my new recycled house out of land-filled plastic. The men came in their 3DTruck and printed my walls, my 3D roof comes tomorrow. The house design is one that I custom designed and ordered on the internet. Once the house is completed I will get a kitchen confectionary 3D printer which will print a range of confectionary items.

The confectionary printer works using a range of printer heads which are filled with varying ingredients which are melted and fed through each head to create designs that taste and look however I want. It will have the ability to print chocolate bars with whatever filling I want, such as jelly or caramel, or it will be able to print me gelatine-based lollies in any colour or shape I choose from the wide customisable range that can be found within the printer's internet connected system. The ingredients are found in any supermarket and refill the cartridges so that I can print confectionary whenever I want.

I am browsing the internet looking for cool furniture to print with my main house printer which will also print my appliances, clothing, cutlery and anything else I want much like my kitchen printer. The clothing will be made from fine, recycled plastic, link based fabrics that are made into a range of designs by the printer.
